

e-Tracker

Use the Internet to connect the farm
to a remote site with
TMR Tracker and the e-Tracker
one of many fine products
from Digi-Star!

The TMR Tracker® and e-Tracker™ Work Together through the use of the internet to connect your TMR Tracker software product on the farm to the e-Tracker at a remote site. This new and exciting technology meets the needs of both nutritionists and dairy farmers. With this technology, you can:

- Receive updated rations from your nutritionist directly into your TMR Tracker program at the dairy
- Send feeding data to your nutritionist for reporting and review
- Send inventory levels to your suppliers for automated reorders
- Access your dairies feeding data from your home or a remote site
- Send updated feeding instructions to the dairy from your home or remote site
- If you own more than one dairy; track each dairies inventory from a central location, review each dairies feeding records, receive commodities at the main dairy and send updated inventory levels to the dairies – all without being onsite at each dairy!

If You're a Nutritionist, you can benefit from today's internet to save time and on-farm visits while still maintaining the latest, up-to-date feeding data. The e-Tracker allows you to:

- Make less on-farm visits, while keeping up-to-date on feeding data
- Track information from multiple dairy operations with one single application
- Easily compare performance between farms
- Keep a standard database for easy transfer between farms
- Generate reports and analysis for a specific dairy and send updated rations to the dairy without having to travel to the farm

Whether you're a dairyman or a nutritionist, whether for use by yourself or to connect with your nutritionist, the e-Tracker provides efficiencies to your operations while maintaining the ease of use and strong reporting features of the TMR Tracker program.
